

INTEGRASPEC[®]

"The User Friendly ICF"

IntegraXT

IntegraXT is the newest feature of the IntegraSpec ICF product line. The ability to install IntegraSpec's independent panels on existing buildings provides homeowners with a cost effective way to achieve award winning performance levels within their existing home.

This type of retro-fitting application provides insulation (R-11), studding, and drainage channels all in one process. The panels are fastened to the existing structure through the use of IntegraSpec's HIPS plastic furring strip inserts which are fused within the panel and provide attachment points for drywall and siding etc. every 8 inches on center.

When installing IntegraXT it is highly recommended that the panels are placed together and connected before fastening them to the wall. In doing this the self leveling nature of the panels is utilized and the installation process is accomplished quickly and with professional results.

The dovetail grooves, located on the inside face of the panels, provides a breathable air gap between the ICF and the existing structure, thus limiting moisture and subsequently any chance of mould or mildew forming.

The installation of IntegraXT on your existing structure greatly increases R-Performance, and the passive nature of this install allows the inhabitants of the home to remain within their residence. It creates a one material substrate for stucco, and is compatible with any exterior/interior cladding you wish to install. Finally, for below grade applications, cost effective waterproofing techniques can be utilized with professional results.
