

INTEGRASPEC[®]

"The User Friendly ICF"

CREATIVE APPLICATION

TIMBER FRAME CONSTRUCTION

IntegraSpec[®] can be used for construction with special needs such as Timber Frame where high strength foundation are required with additional width and support for the wider posts.

Advantages:

- Accurate foundation with larger concrete surface at the top of the wall and easily formed pilasters. ICF construction eliminates moisture and condensation.

LOG HOME CONSTRUCTION

IntegraSpec[®] can be used for special need construction such as Log Homes where heavy compression weight is a concern.

Advantage:

- Structurally stronger foundation with wider concrete surface for log support while reducing costs with smaller main concrete core. ICF construction meets or exceeds the high insulation of the log home.

RE-LOCATED HOME CONSTRUCTION

IntegraSpec[®] can be used for special need construction such as pre-built homes requiring new foundations.

Advantages:

- Accurately dimensioned wall construction to fit existing home measurements. Patented panel design allows walls to be constructed with minimal space under the house for less damage and costs.
